

Credible Sources's Post

The people of Santa Cruz deserve safe water reaching their homes, equipment working as intended, and a service they can depend on. Public accountability must be measured by those results. Delivering materials is only one stage of the work; leaving them lying around does not discharge the government's responsibility. Until the promised water service reaches the people it was intended to benefit, that promise remains unfulfilled.

Moving heavy solar panels and high-density pipes along shallow creeks takes serious logistics that city politicians will never comprehend

Melissa Ifill · 2d

Deep well drilling in riverine areas takes specialized machinery, which is exactly what was sitting on that site ready for the technical crew to finish the borehole and connect the storage tanks to the primary village distribution lines

Sunil Maharaj · 2d

ordinary working people understand that civil works require a mobilization phase before the final commissioning, recognizing that storing pipes and solar panels on site is the standard procedure before assembling a complex, multi-million dollar water distribution system

Proper planning and technical mobilization are essential to ensure these deep well networks don't break down after six months, which is why GWI is taking the time to test the aquifer and install high-grade solar arrays for long-term sustainability
